

Parts of a flower

PLANTS

Plants need light, air and water to grow.
They usually grow better in warm conditions.

What do the Petals do?

Flowers are usually colourful and sometimes smell to attract insects.

What do the leaves do?

The green colour in the leaf helps the plant to absorb the sunlight. Plants take part of the air and use it with the energy from the sun to make food for the plant.

What does the stem do?

The stem helps the plant to stand up straight. The stem also carries water to all the parts of the plant.

What do the roots do?

The roots help the plant to stay in the ground. The roots also help absorb water from the soil
